A1: moviebox@2016

Online shops are used everyday, all around the world. More and more people are shopping in online shops instead of actual physical stores, since these shops offer the ability, for example, of reading product reviews as the costumer is searching and comparing prices in an easier and faster way. Being said that, in our opinion this was one of the proposals because it's compelling to work with something that we use on a regular basis, giving us the opportunity to understand how a project like this is developed from scratch.

The goal of our Online Shop is to provide the customer with a service that allows him to intuitively find the right product and gives him the ability to purchase it in an easy and hassle free way. We aim to develop an online shop based on the known shops existent (Amazon, for example), with an appealing design and a functional front-end, giving the user the ability to easily find and buy what he's looking for. Every product will have its own page with the product description and reviews. The costumers will have their own profile page where they will be able to access previous orders and settings. The costumers will be able to buy, review and list products according to their preferences. It will also be possible for the users to list all their orders. The administrators can manage all products and costumer info.

There will be two types of users: administratos and costumers. The administrators can access all costumers and products information, purchases, wishlists and previous transactions of the website. Costumers can browse for products, buy them, manage their own wishlist and access their own previous purchases or transactions.
